

Project Name: "Qualitypluse"

The Big Idea

This project is about building an automated quality assurance system to protect the booking process on a hotel website. Think of it as a smart, automated guard that runs in the background, making sure that every single booking goes through without a hitch. This guarantees a smooth user experience and prevents any lost revenue due to website errors.

Your Action Plan

- **Set Up:** Get started with **Selenium WebDriver** to automate the browser and write your test scripts.
- **Test the Flow:** Write tests that cover the full booking journey. Your script will automatically fill in the form, select dates, and verify that the booking

confirmation is successful.

- **Use a Pro Method:** Structure your code with the **Page Object Model (POM)**. This makes your project look professional and keeps your code clean, readable, and easy to maintain.
- **Show Your Work:** Run your tests and generate a report. This report will prove that your "shield" is working perfectly, showing you can deliver real, tangible value.

This project is not just a test; it's a solution that proves you can build professional, reliable tools to protect a company's most important functions.
